

2 Modules

2.5 Tensor product and weak dimension

- (1) Since $0 \rightarrow I \rightarrow R \rightarrow R/I \rightarrow 0$ is exact,

$$I \otimes R/J \xrightarrow{f} R/J \rightarrow R/I \otimes R/J \rightarrow 0$$

is exact, where $Im(f) = \{\sum_i ar + J | a \in I, r \in R\} = (I + J)/J$, then $R/I \otimes R/J \cong R/J/(I + J/J) \cong R/(I + J)$.

- (2) $\mathbb{Z}_m \otimes \mathbb{Z}_n \cong \mathbb{Z}/(m\mathbb{Z} + n\mathbb{Z}) = \mathbb{Z}/d\mathbb{Z}$ where $d = (m, n)$.
- (2) Suppose M is a F -vector space generated by $\{v_i | i \in I\}$. Define $\varphi : F \times V \rightarrow M$, $\varphi(a, v) = av$, then φ is a K -bilinear mapping. Let $\lambda : F \times V \rightarrow F \otimes V$, $\lambda(a, v) = a \otimes v$, then there is a unique F -vector space map Φ satisfied $\Phi \circ \lambda = \varphi$. Since ${}_F F_K$ is a bimodule, $F \otimes V$ is F vector space, for any $a, b_i \in F$ and any $v_i \in V$, $\Phi(a \sum b_i \otimes v_i) = \Phi(\sum ab_i \otimes v_i) = \sum \Phi(ab_i \otimes v_i) = \sum \varphi(ab_i, v_i) = \sum ab_i v_i = a \sum b_i v_i = a \sum \Phi(b_i \otimes v_i) = a \Phi(\sum b_i \otimes v_i)$, thus Φ is a F -linear mapping. Since $\{\Phi(1 \otimes v_i) = v_i | i \in I\}$ is a basis of M over K , $\{1 \otimes v_i | i \in I\}$ is linearly independent over K . It is obvious that $Span(\{1 \otimes v_i | i \in I\}) = F \otimes V$. Hence $\{1 \otimes v_i | i \in I\}$ is a basis of $F \otimes V$ as a vector space over F .
- (3) It is easy to testify that

$$\iota : M_1 \times \cdots \times M_n \rightarrow M_1 \otimes_{R_1} \cdots \otimes_{R_{n-1}} M_n,$$

$\iota(m_1, \cdots, m_n) = m_1 \otimes \cdots \otimes m_n$, is a n -multiplicity middle linear mapping for $m_1 \otimes \cdots \otimes m_{i-1} \otimes (\lambda x_i + \mu y) \otimes m_{i+1} \otimes \cdots \otimes m_n = (m_1 \otimes \cdots \otimes m_{i-1} \otimes (\lambda x_i + \mu y)) \otimes (m_{i+1} \otimes \cdots \otimes m_n)$. Let $L(M_1, M_2, \cdots, M_n; G)$ is a set of all middle linear mapping from $M_1 \times \cdots \times M_n$ to abelian group G which constructs an abelian group.

$$\varphi_1 : L(M_1, M_2, \cdots, M_n; G) \cong Hom_{R_{n-1}}(M_n, L(M_1, M_2, \cdots, M_{n-1}; G))$$

where $L(M_1, M_2, \cdots, M_{n-1}; G)$ is a set of all middle linear mapping whose left R_{n-1} -module is defined as

$$(rf)(m_1, \cdots, m_{n-1}) := f(m_1, \cdots, m_{n-2}, m_{n-1}r).$$

$(\varphi_1(f)(m_n))(m_1, \cdots, m_{n-1}) := f(m_1, \cdots, m_{n-1}, m_n)$. Then to proof the conclusion of this exercise is equivalent to proof

$$\iota^* : Hom(M_1 \otimes_{R_1} \cdots \otimes_{R_{n-1}} M_n; G) \rightarrow L(M_1, M_2, \cdots, M_n; G)$$

is isomorphic. By induction on n , when $n = 2$, the conclusion is true for Thm 2.5.1. Define

$$\varphi_2 : \text{Hom}(M_1 \otimes_{R_1} \cdots \otimes_{R_{n-1}} M_n; G) \rightarrow \text{Hom}_{R_{n-1}}(M_n, \text{Hom}_{\mathbb{Z}}(M_1, \cdots, M_{n-1}; G)),$$

$$\varphi_2(f)(m_n)(m_1 \otimes \cdots \otimes m_{n-1}) = f(m_1 \otimes \cdots \otimes m_n).$$

$$\varphi_3 : \text{Hom}_{R_{n-1}}(M_n, \text{Hom}_{\mathbb{Z}}(M_1, \cdots, M_{n-1}; G)) \rightarrow \text{Hom}_{R_{n-1}}(M_n, L(M_1, \cdots, M_{n-1}; G)),$$

$$\begin{aligned} \varphi_3(f)(m_n)(m_1, \cdots, m_{n-1}) &= f(m_n)(m_1 \otimes \cdots \otimes m_{n-1}) \\ &= (\iota^*)^{-1}(f(m_n))(m_1 \otimes \cdots \otimes m_{n-1}) \end{aligned}$$

is an isomorphism by induction. Since φ_1 is isomorphic, φ_1^{-1} is isomorphic. Then $\varphi_2^{-1} \circ \varphi_3^{-1} \circ \varphi_1 : L(M_1, M_2, \cdots, M_n; G) \rightarrow \text{Hom}(M_1 \otimes_{R_1} \cdots \otimes_{R_{n-1}} M_n; G)$, $(\varphi_2^{-1} \circ \varphi_3^{-1} \circ \varphi_1)(f)(a_1 \otimes \cdots \otimes a_n) = [(\varphi_3^{-1} \circ \varphi_1)(f)(a_n)](a_1 \otimes \cdots \otimes a_{n-1}) = \varphi_1(f)(a_n)(a_1, \cdots, a_{n-1}) = f(a_1, \cdots, a_n)$ for any $f \in L(M_1, M_2, \cdots, M_n; G)$ and any $a_1 \otimes \cdots \otimes a_n \in M_1 \otimes_{R_1} \cdots \otimes_{R_{n-1}} M_n$, is isomorphic. Thus $(\varphi_2^{-1} \circ \varphi_3^{-1} \circ \varphi_1)(f) \circ \iota = f$ and $(\varphi_2^{-1} \circ \varphi_3^{-1} \circ \varphi_1)(f)$ is unique.

4. Suppose that e_{ij} be matrix identity of $M_s(K)$ and ε_{ij} be matrix identity of $M_t(K)$, then $\{e_{ij} \otimes \varepsilon_{pq} | 1 \leq i, j \leq s, 1 \leq p, q \leq t\}$ is a basis of $M_s(K) \otimes_K M_t(K)$. Define $\varphi : M_s(K) \otimes_K M_t(K) \rightarrow M_{st}(K)$, $\varphi(e_{ij} \otimes \varepsilon_{pq}) = g_{i+(p-1)s, j+(q-1)s}$ where g_{ij} is matrix identity of $M_{st}(K)$. Thus

$$\begin{aligned} (e_{ij} \otimes \varepsilon_{pq})(e_{i'j'} \otimes \varepsilon_{p'q'}) &= e_{ij}e_{i'j'} \otimes \varepsilon_{pq}\varepsilon_{p'q'} \\ &= \delta_{ji'}e_{ij} \otimes \delta_{qp'}\varepsilon_{pq} \mapsto \delta_{ji'}\delta_{qp'}g_{i+(p-1)s, j'+(q'-1)s} \end{aligned}$$

and $g_{i+(p-1)s, j+(q-1)s}g_{i'+(p'-1)s, j'+(q'-1)s} = \delta_{j+(q-1)s, i'+(p'-1)s}g_{i+(p-1)s, j'+(q'-1)s}$. When $j = i', p = q'$, $\delta_{j+(q-1)s, i'+(p'-1)s} = 1$, inverse, if $j + (q-1)s = i' + (p'-1)s$, then $i' - j = (q-p')s$, thus $j = i', p = q'$ for $1 \leq i, j \leq s$. Hence φ is isomorphic.

5.

$$\begin{array}{ccccccc} I \otimes L & \xrightarrow{f_1} & I \otimes M & \xrightarrow{f_2} & I \otimes N & \longrightarrow & 0 \\ \varphi_1 \downarrow & & \varphi_2 \downarrow & & \varphi_3 \downarrow & & \\ 0 \longrightarrow & IL & \xrightarrow{g_1} & IM & \xrightarrow{g_2} & IN & \longrightarrow 0 \end{array}$$

Since L and N are flat, then φ_1 and φ_3 is injective. According to Snake Lemma, $\text{Ker}\varphi_1 \xrightarrow{f_1} \text{Ker}\varphi_2 \xrightarrow{f_2} \text{Ker}\varphi_3$, i.e. φ_2 is injective. According to Proposition 2.5.5, M is flat.

6. $\mathbb{C}[G] \cong M_{n_1}(\mathbb{C}) \oplus \cdots \oplus M_{n_r}(\mathbb{C})$, then $T \cong \left\{ \begin{pmatrix} a_1 \\ \vdots \\ a_{n_i} \end{pmatrix} \mid a_i \in \mathbb{C} \right\}$, thus the multiple of T in $\mathbb{C}[G]$ is $n_i = \dim_{\mathbb{C}} T$.

7. For any finitely generated left ideal, consider

$$\begin{array}{ccccccc} K \otimes I & \xrightarrow{f} & M \otimes I & \xrightarrow{g} & M/K \otimes I & \longrightarrow & 0 \\ \varphi_3 \downarrow & & \varphi_1 \downarrow & & \downarrow \varphi_2 & & \\ 0 \longrightarrow & KI & \xrightarrow{f_1} & MI & \xrightarrow{g_1} & (M/K)I (= MI/K) & \longrightarrow 0 \end{array}$$

When $\text{Ker} g_1 = MI \cap K = KI = \text{Im} f_1$, for any $a \in \text{Ker} g_2$, there is $b \in M \otimes I$ such that $g(b) = a$, then $\varphi_2 g(b) = \varphi_2(a) = g_1 \varphi_1(b) = 0$, thus $\varphi_1(b) \in \text{Ker} g_1 = \text{Im} f_1$, therefore there is $c \in KI$ such that $f_1(c) = \varphi_1(b)$ and there is $d \in K \otimes I$ such that $\varphi_3(d) = c$, hence $f_1 \varphi_3(d) = f_1(c) = \varphi_1(b) = \varphi_1 f(d)$. Since φ_1 is isomorphic, $b = f(d)$, then $a = g(b) = gf(d) = 0$, thus M/K is flat. Contrary, if φ_2 is isomorphic, then φ_1 and φ_2 is isomorphic, while $\varphi_2 g = g_1 \varphi_1$, thus $\text{Ker} g_1 \cong \text{Ker} g = \text{Im} f$. For any $x \in KI$, there is $y \in K \otimes I$ such that $\varphi_3(y) = x$, then $f_1 \varphi_3(y) = f_1(x) = \varphi_1 f(y)$, thus $f_1(x) \in \text{Ker} g_1$, therefore $\text{Im} f_1 \subseteq \text{Ker} g_1 = MI \cap K$. If $a \in \text{Ker} g_1$, there is $b \in M \otimes I$ such that $\varphi_1(b) = a$. Since $g_1 \varphi_1(b) = g_1(a) = 0$, $\varphi_2 g(b) = 0$, then $g(b) = 0$ for φ_2 is injective, thus there is $c \in K \otimes I$ such that $b = f(c)$ and $\varphi_1 f(c) = f_1 \varphi_3(c) = \varphi_1(b) = a \in \text{Im} f_1$. Hence $\text{Ker} g_1 = \text{Im} f_1$. Therefore $KI = MI \cap K$.

8. If M is injective and $M \leq N$, then $N = M \oplus L$. Thus for any finitely generated right ideal I , there is $IN = IM + IL$, then $IN \cap M = (IM + IL) \cap M = IM + (IL \cap M) = IM$ for $IL \cap M \subseteq L \cap M = 0$.

9. If ${}_R M$ is flat and $\sum_{j=1}^n a_j v_j = 0$, let $I = \sum_{j=1}^n a_j R$ and F is free which basis is

$\{x_1, \dots, x_n\}$. Consider the exact sequence $0 \longrightarrow K \xrightarrow{f} F \xrightarrow{g} I \longrightarrow 0$ where $g(\sum x_j r_j) = \sum a_j v_j, f(a) = a$. Consider the exact sequence

$$0 \longrightarrow K \otimes_R M \xrightarrow{f \otimes id_M} F \otimes_R M \xrightarrow{g \otimes id_M} I \otimes_R M \longrightarrow 0,$$

since $\sum_{j=1}^n a_j v_j = 0$ and $I \otimes M \rightarrow IM, \sum r_j \otimes m_j \mapsto \sum r_j m_j$ is isomorphic,

$k_i = \sum_{j=1}^n x_j c_{ij}$. Since $\sum_{j=1}^n a_j v_j = 0$, $\sum_{j=1}^n a_j \otimes v_j = 0$ where $a_j \in I$, then $(g \otimes id_M)(\sum_{j=1}^n x_j \otimes v_j) = \sum_{j=1}^n a_j \otimes v_j = 0$, thus $\sum_{j=1}^n x_j \otimes v_j \in \text{Ker}(g \otimes id_M) = \text{Im}(f \otimes id_M)$, then there is $\sum_{j=1}^m k_j \otimes m_j \in K \otimes M$ such that $\sum_{j=1}^n x_j \otimes v_j =$

$\sum_{j=1}^m k_j \otimes m_j$. While $k_i \in K \subseteq F$, then $k_i = \sum_{j=1}^n x_j c_{ij}$, thus $\sum_{j=1}^n x_j \otimes v_j = \sum_{j=1}^n x_j \otimes \sum_{i=1}^m a_{ij} m_i$, while x_1, \dots, x_n is a basis, $v_j = \sum_{i=1}^m c_{ij} m_i (j = 1, \dots, n)$ and $\sum_{j=1}^n a_j c_{ij} = \sum_{j=1}^n f(x_j) c_{ij} = f(\sum x_j c_{ij}) = f(k_i) = 0$. Contradiction, since $I \otimes M \rightarrow IM$, $\sum a_i \otimes m_i \mapsto \sum a_i m_i$, is injective for any finitely generated right ideal, ${}_R M$ is flat.

10. According to Exercise 2.3.13, $R^m \oplus K \cong R^n \oplus K'$, then $R^m \oplus K$ is finitely generated, thus $R^n \oplus K'$ is finitely generated. Let $\pi : R^n \oplus K' \rightarrow K'$ is a canonical projective map and x_1, \dots, x_p are generators of $R^n \oplus K'$, then $\pi(x_1), \dots, \pi(x_n)$ are generators of K' .

11. Suppose that ${}_R M$ is a finitely presented flat module, then there are m, n and module homomorphism f_0, f_1 such that ${}_R R^m \xrightarrow{f_1} {}_R R^n \xrightarrow{f_0} {}_R M \rightarrow 0$ is exact for any finitely generated right ideal I . Consider commute diagram

$$\begin{array}{ccccc} I \otimes R^m & \xrightarrow{id_I \otimes f_1} & I \otimes R^n & \xrightarrow{id_I \otimes f_0} & I \otimes M \longrightarrow 0 \\ \varphi_1 \downarrow & & \varphi_2 \downarrow & & \downarrow \varphi_3 \\ I^m & \xrightarrow{g_1} & I^n & \xrightarrow{g_0} & IM \end{array}$$

$b \in I \otimes R^n$ such that $a = (id_I \otimes f_0)(b)$, then $g_0 \varphi_2(b) = \varphi_3(a) = 0$, thus $\varphi_2(b) \in \text{Ker } g_0 = \text{Im } g_1$, there is $c \in I^m$ such that $g_1(c) = \varphi_2(b)$, therefore there is $d \in I \otimes R^m$ such that $\varphi_1(d) = c$. Hence $\varphi_2(id_I \otimes f_1)(d) = g_1 \varphi_1(d) = g_1(c) = \varphi_2(b)$, since φ_2 is isomorphic, $(id_I \otimes f_1)(d) = b$, then $a = (id_I \otimes f_0)(b) = (id_I \otimes f_0)(id_I \otimes f_1)(d) = 0$. Hence φ_3 is isomorphism, then ${}_R M$ is flat.

12. (1) \Rightarrow (2): Since R_R is flat, R_R^I is flat by (1).

(2) \Rightarrow (3): Suppose that $I \leq_R R$ and F is a free module with free basis x_1, \dots, x_n that maps onto ${}_R I : F \xrightarrow{f} I \rightarrow 0$. For each $j = 1, \dots, n$, let $a_j = f(x_j)$ and let $K = \text{Ker } f$, then $k = \sum_{i=1}^n a_i x_i, a_i \in R$ for any $k \in \text{Ker } f$,

thus $\varphi_i : K \rightarrow R, \varphi_i(\sum_{i=1}^n a_i x_i) = a_i$ and $\varphi_i \in \text{Hom}_R(K, R), (i = 1, \dots, n)$.

Consider R^K , according to Exercise 1.6.8, there is an isomorphism Ψ from $\prod_{k \in K} R$ to $\{f|f : K \rightarrow R\}$. Let $v_i = \Psi^{-1}(\varphi_i), (i = 1, \dots, n)$, then $v_i \in R^K$

satisfies $k = \sum_{i=1}^n a_i x_i = \sum_{i=1}^n \varphi_i(k) x_i = \sum_{i=1}^n \pi_k(v_i) x_i$ for any $k \in K$, thus

$$0 = f(k) = \sum_{i=1}^n \pi_k(v_i) f(x_i) = \sum_{i=1}^n \pi_k(v_i) a_i = \pi_k(\sum_{i=1}^n v_i a_i) \text{ for any } k \in K,$$

therefore $\sum_{i=1}^n v_i a_i = 0 \in R^K$. Since R^K is flat, there are $u_1, \dots, u_m \in R^K$

and $c_{ij} \in R$ such that $\sum_{j=1}^n c_{ij}a_j = 0$ and $v_j = \sum_{i=1}^m u_i c_{ij}$. Let $k_i = \sum_{j=1}^n c_{ij}x_j$, then $f(k_i) = \sum_{j=1}^n a_j f(x_j) = \sum_{j=1}^n c_{ij}a_j = 0$, thus $k_1, \dots, k_n \in K$, while $k = \sum_{j=1}^n \pi_k(v_j)x_j = \sum_{j=1}^n \pi_k(\sum_{i=1}^m u_i c_{ij})x_j = \sum_{i=1}^m \pi_k(u_i) \sum_{j=1}^n c_{ij}x_i$ for any $k \in K$. Therefore $K = Rk_1 + \dots + Rk_n$ is finitely generated.

(3) \Rightarrow (1): If $M_\alpha, \alpha \in A$ are flat right R -module, then there is B and surjective map $g_\alpha : R^{(B)} \rightarrow M_\alpha$, thus $0 \rightarrow K_\alpha \rightarrow R^{(B)} \rightarrow M_\alpha \rightarrow 0$, then $0 \rightarrow \prod_{\alpha \in A} K_\alpha \rightarrow \prod_{\alpha \in A} R^{(B)} \rightarrow \prod_{\alpha \in A} M_\alpha \rightarrow 0$. For any finitely generated left ideal I , $(\prod_{\alpha \in A} K_\alpha)I = \prod_{\alpha \in A} K_\alpha I = \prod_{\alpha \in A} (K_\alpha \cap R^{(B)}I) = \prod_{\alpha \in A} K_\alpha \cap (\prod_{\alpha \in A} R^{(B)}I) = \prod_{\alpha \in A} K_\alpha \cap (\prod_{\alpha \in A} R^{(B)})I$, then $\prod_{\alpha \in A} K_\alpha$ is a pure submodule of $\prod_{\alpha \in A} R^{(B)}$. If $\prod_{\alpha \in A} R^{(B)}$ is flat, then $\prod_{\alpha \in A} M_\alpha$ is flat. If $v_j \in \prod_{\alpha \in A} R^{(B)}, a_j \in R$ such that $\sum_{j=1}^n v_j a_j = 0$. Let $f : R^n \rightarrow \sum_{j=1}^n Ra_j, (r_1, \dots, r_n) \mapsto \sum_{j=1}^n r_j a_j$, then $\text{Ker } f = Rk_1 + \dots + Rk_m$ where $k_i = (c_{i1}, \dots, c_{in}) \in \text{Ker } f$, thus $\sum_{j=1}^n c_{ij}a_j = f(k_i) = 0$. Let $v_j = (v_{j\alpha})_{\alpha \in A}, v_{j\alpha} \in R^{(B)}$ for any $\alpha \in A$. Therefore $\sum_{j=1}^n v_j a_j = \sum_{j=1}^n (v_{j\alpha})_{\alpha \in A} a_j = 0$, then $\sum_{j=1}^n v_{j\alpha} a_j = 0$ for any $\alpha \in A$, since $v_{1\alpha}, \dots, v_{n\alpha} \in R^{(B)}, v_{j\alpha} = (0, \dots, 0, v_{j\alpha\beta_1}, \dots, v_{j\alpha\beta_s}, 0, \dots, 0) (j = 1, \dots, n)$, then $\sum_{j=1}^n v_{j\alpha\beta_p} a_j = 0$ for all $1 \leq p \leq s$. Thus $(v_{1\alpha\beta_p}, \dots, v_{n\alpha\beta_p}) \in \text{Ker } f$, then $(v_{1\alpha\beta_p}, \dots, v_{n\alpha\beta_p}) = r_{\alpha\beta_{p1}} k_1 + \dots + r_{\alpha\beta_{pn}} k_n$. Let $u_i \neq (0, \dots, 0, r_{\alpha\beta_{1i}}, \dots, r_{\alpha\beta_{si}}, 0, \dots, 0)$, then $v_j = \sum_{i=1}^n u_i c_{ij}$. Hence $\prod_{\alpha \in A} R^{(B)}$ is flat.

13. If $\sum_{i \in I} \oplus M_i$ is a faithful flat module, then ${}_R M_i$ is flat for any $i \in I$. For exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$, there is

$$0 \rightarrow A \otimes \sum \oplus M_i \rightarrow B \otimes \sum \oplus M_i \rightarrow C \otimes \sum \oplus M_i \rightarrow 0.$$

On contrary, if

$$\begin{array}{ccccccc} 0 & \longrightarrow & A \otimes \sum \oplus M_i & \longrightarrow & B \otimes \sum \oplus M_i & \longrightarrow & C \otimes \sum \oplus M_i \longrightarrow 0 \\ & & \cong \downarrow & & \cong \downarrow & & \cong \downarrow \\ 0 & \longrightarrow & \sum \oplus A \otimes M_i & \xrightarrow{(f_i)_{i \in I}} & \sum \oplus B \otimes M_i & \longrightarrow & \sum \oplus C \otimes M_i \longrightarrow 0 \end{array}$$

where $f_i : A \otimes M_i \rightarrow B \otimes M_i$ and $\sum \oplus \text{Ker} f_i = \text{Ker}(f_i)_{i \in I}$, then

$$0 \longrightarrow A \otimes M_i \longrightarrow B \otimes M_i \longrightarrow C \otimes M_i \longrightarrow 0$$

is exact for any $i \in I$. Thus ${}_R M_i$ is faithful flat for any $i \in I$. If ${}_R M_i$ is faithful flat for any $i \in I$, then $\sum \oplus M_i$ is flat. If

$$0 \longrightarrow A \otimes \sum \oplus M_i \longrightarrow B \otimes \sum \oplus M_i \longrightarrow C \otimes \sum \oplus M_i \longrightarrow 0$$

is exact, then $0 \longrightarrow A \otimes M_i \longrightarrow B \otimes M_i \longrightarrow C \otimes M_i \longrightarrow 0$ is exact, thus

$$0 \longrightarrow A \longrightarrow B \longrightarrow C \longrightarrow 0 \text{ is exact. Hence } \sum \oplus M_i \text{ is faithful flat.}$$

14. (\Rightarrow) :If ${}_R M$ is a injective cogenerator and $0 \longrightarrow A \xrightarrow{f} B \xrightarrow{g} C \longrightarrow 0$ is exact, then $0 \longrightarrow \text{Hom}_R(C, M) \xrightarrow{g^*} \text{Hom}_R(B, M) \xrightarrow{f^*} \text{Hom}_R(A, M) \longrightarrow 0$ is exact. On contrary, if

$$0 \longrightarrow \text{Hom}_R(C, M) \xrightarrow{g^*} \text{Hom}_R(B, M) \xrightarrow{f^*} \text{Hom}_R(A, M) \longrightarrow 0$$

is exact, if $0 \neq a \in \text{Ker} f$, then there is $\alpha \in \text{Hom}_R(A, M)$ such that $\alpha(a) \neq 0$, while f^* is surjective, there is $\beta \in \text{Hom}_R(B, M)$ such that $f^*(\beta) = \alpha$, i.e. $\alpha = \beta f$, then $\alpha(a) = \beta f(a) = 0$, it is contradiction. Hence $\text{Ker} f = 0$. If $g \circ f \neq 0$, there is $a \in A$ such that $gf(a) \neq 0$, there is $\alpha \in \text{Hom}_R(C, M)$ such that $0 \neq \alpha gf(a) = f^* g^*(\alpha)(a) = 0$, it is contradiction. Hence $gf = 0$, i.e. $\text{Im} f \subseteq \text{Ker} g$. Suppose $\pi : C \rightarrow C/\text{Im} g$, $\pi(x) = x + \text{Im} g$, then $\pi \circ g : B \rightarrow C/\text{Im} g$ is a zero mapping. $\pi_* : \text{Hom}_R(C/\text{Im} g, M) \rightarrow \text{Hom}_R(C, M)$ is injective, then $g^* \pi_* : \text{Hom}_R(C/\text{Im} g, M) \rightarrow \text{Hom}_R(B, M)$ is injective. $g^* \pi_*(\alpha) = \alpha \circ \pi \circ g = 0$ for $\alpha \in \text{Hom}_R(C/\text{Im} g, M)$, then $\alpha = 0$. Since M is a cogenerator, $C/\text{Im} g = 0$, then g is surjective. Let $\varphi : \text{Ker} g \rightarrow \text{Ker} g/\text{Im} f$, $\varphi(a) = a + \text{Im} f$, then $\varphi \circ f = 0$, while $\varphi^* : \text{Hom}_R(\text{Ker} g/\text{Im} f, M) \rightarrow \text{Hom}_R(\text{Ker} g, M)$ is injective, $\varphi^*(\alpha) \in \text{Hom}_R(\text{Ker} g, M)$ for any $\alpha \in \text{Hom}_R(\text{Ker} g/\text{Im} f, M)$. Since $0 \longrightarrow \text{Ker} g \longrightarrow B \longrightarrow B/\text{Ker} g \longrightarrow 0$ is exact,

$$0 \longrightarrow \text{Hom}_R(B/\text{Ker} g, M) \longrightarrow \text{Hom}_R(B, M) \longrightarrow \text{Hom}_R(\text{Ker} g, M) \longrightarrow 0$$

is exact, then there is $\Psi \in \text{Hom}_R(B, M)$ such that $\Psi|_{\text{Ker} g} = \varphi^*(\alpha)$, thus $\varphi^*(\alpha)(a) = \alpha \varphi(a) = \Psi(a)$. Since $f^*(\Psi)(x) = \Psi(f(x)) = 0$ for any $x \in A$, $\Psi \in \text{Ker} f^* = \text{Im} g^*$, then there is $\eta \in \text{Hom}_R(C, M)$ such that $g^*(\eta) = \eta g = \Psi$, thus $\varphi^*(\alpha)(a) = \alpha \varphi(a) = \Psi(a) \eta g(a) = 0$ for any $a \in \text{Ker} g$. Therefore $\varphi^*(\alpha) = 0$. Since φ^* is injective, $\alpha = 0$, then $\text{Hom}_R(\text{Ker} g/\text{Im} f, M) = 0$ for α is arbitrary. Since M is cogenerator, $\text{Ker} g/\text{Im} f = 0$, i.e. $\text{Ker} g = \text{Im} f$. This means that

$$0 \longrightarrow A \xrightarrow{f} B \xrightarrow{g} C \longrightarrow 0$$

is exact.

(\Leftarrow) : Consider $0 \rightarrow M \xrightarrow{f} E \xrightarrow{g} N \rightarrow 0$ is exact where E is injective, then

$$0 \rightarrow \text{Hom}_R(N, M) \xrightarrow{g^*} \text{Hom}_R(E, M) \xrightarrow{f^*} \text{Hom}_R(M, M) \rightarrow 0$$

is exact, thus there is $k \in \text{Hom}_R(E, M)$ such that $f^*(k) = kf = \text{id}_M$, then $0 \rightarrow M \xrightarrow{f} E \xrightarrow{g} N \rightarrow 0$ is split, i.e. $E \cong M \oplus N$, then M is injective. For any $0 \neq a \in R$, $0 \rightarrow Ra \xrightarrow{\lambda} L \xrightarrow{\pi} L/Ra \rightarrow 0$ is exact, then

$0 \rightarrow \text{Hom}_R(L/Ra, M) \xrightarrow{\pi^*} \text{Hom}_R(L, M) \xrightarrow{\lambda^*} \text{Hom}_R(Ra, M) \rightarrow 0$ is exact. If $\text{Hom}_R(Ra, M) = 0$, then

$$0 \rightarrow \text{Hom}_R(L/Ra, M) \xrightarrow{\pi^*} \text{Hom}_R(L, M) \xrightarrow{\lambda^*} \text{Hom}_R(0, M) \rightarrow 0$$

is exact, thus $0 \rightarrow 0 \xrightarrow{\lambda} L \xrightarrow{\pi} L/Ra \rightarrow 0$ is exact. Therefore π is isomorphic, then $\text{Ker} \pi = Ra = 0$, it is contradiction. Hence $\text{Hom}_R(Ra, M) \neq 0$, i.e. there is $f \in \text{Hom}_R(Ra, M)$ such that $f(a) \neq 0$, that is M is a cogenerator.

15. (\Rightarrow) : If ${}_R M$ is a projective generator and $0 \rightarrow A \xrightarrow{f} B \xrightarrow{g} C \rightarrow 0$ is exact, then $0 \rightarrow \text{Hom}_R(M, A) \xrightarrow{f_*} \text{Hom}_R(M, B) \xrightarrow{g_*} \text{Hom}_R(M, C) \rightarrow 0$ is exact. On contrary, if $\text{Ker} f \neq 0$, then there is $0 \neq \alpha \in \text{Hom}_R(M, \text{Ker} f)$, $0 \neq \lambda \alpha \in \text{Hom}_R(M, A)$ for $M \xrightarrow{\alpha} \text{Ker} f \xrightarrow{\lambda} A \rightarrow 0$, $f_*(\lambda \alpha) = f \lambda \alpha = 0$, it is contradiction for f_* is injective. Hence f is injective. For any $c \in C$, there is $\varphi \in \text{Hom}_R(M, C)$ such that $\varphi(a) = c$ for $a \in M$. Since g_* is surjective, there is $\Psi \in \text{Hom}_R(M, B)$ such that $g_* \Psi = g \Psi = \varphi$, then $\varphi(a) = g \Psi(a) \in \text{Img}$. Hence g is surjective. If $gf \neq 0$, there is $a \in A$ such that $gf(a) \neq 0$, then there is $\varphi \in \text{Hom}_R(M, A)$ such that $\varphi(m) = a$ for some $m \in M$, thus $gf \varphi(m) \neq 0$, i.e. $(gf)_* \neq 0$, it is contradiction. Hence $gf = 0$. Since $gf = 0$, then $\text{Img} f \subseteq \text{Ker} g$. For $A \xrightarrow{f} \text{Ker} g \xrightarrow{\pi} \text{Ker} g / \text{Img} f \rightarrow 0$, if $\text{Ker} g / \text{Img} f \neq 0$, there is $0 \neq \eta \in \text{Hom}_R(M, \text{Ker} g / \text{Img} f)$, since M is projective, there is $\zeta : M \rightarrow \text{Ker} g \subseteq B$ such that $\pi \zeta = \eta$, then $g \zeta = 0 = g_*(\zeta)$, thus $\zeta \in \text{Ker} g_* = \text{Img} f_*$, therefore there is $\sigma \in \text{Hom}_R(M, A)$ such that $\zeta = f \sigma$, then $\pi \zeta = \eta = \pi f \sigma = 0$. It is contradiction for $\eta \neq 0$. Hence $\text{Ker} g / \text{Img} f = 0$, i.e. $\text{Ker} g = \text{Img} f$, then $0 \rightarrow A \xrightarrow{f} B \xrightarrow{g} C \rightarrow 0$ is exact.

(\Leftarrow) : Let $\varphi : {}_R F \rightarrow {}_R M$ is epimorphic and F is free, then

$$0 \rightarrow \text{Ker} \varphi \rightarrow F \xrightarrow{\varphi} M \rightarrow 0$$

is exact, thus

$$0 \longrightarrow \text{Hom}_R(M, \text{Ker}\varphi) \longrightarrow \text{Hom}_R(M, F) \xrightarrow{\varphi_*} \text{Hom}_R(M, M) \longrightarrow 0$$

is exact. Then there is $h \in \text{Hom}_R(M, F)$ such that $\varphi_*(h) = \varphi h = \text{id}_M$, thus $0 \longrightarrow \text{Ker}\varphi \longrightarrow F \xrightarrow{\varphi} M \longrightarrow 0$ is split, i.e. $F \cong M \oplus \text{Ker}\varphi$, then M is projective. For any ${}_R N$ and any $0 \neq x \in {}_R N$,

$$0 \longrightarrow Rx \xrightarrow{\lambda} N \xrightarrow{\pi} N/Rx \longrightarrow 0$$

is exact, then

$$0 \longrightarrow \text{Hom}_R(M, Rx) \xrightarrow{\lambda_*} \text{Hom}_R(M, N) \xrightarrow{\pi_*} \text{Hom}_R(M, N/Rx) \longrightarrow 0$$

is exact. If there is not $f \in \text{Hom}_R(M, N)$ such that $x \in \text{Im}f$, then $\text{Hom}_R(M, Rx) = 0$,

$$0 \longrightarrow \text{Hom}_R(M, 0) \xrightarrow{0_*} \text{Hom}_R(M, N) \xrightarrow{\pi_*} \text{Hom}_R(M, N/Rx) \longrightarrow 0$$

is exact, thus $0 \longrightarrow 0 \xrightarrow{0} N \xrightarrow{\pi} N/Rx \longrightarrow 0$ is exact. Therefore $\text{Ker}\pi = 0$, it is contradiction. Hence there is $f \in \text{Hom}_R(M, N)$ such that $x \in \text{Im}f$, then M is a generator.

16. Suppose that $R^F = R^{(I)}$ is free, then it is projective. For any $0 \neq x \in {}_R M$, $\text{Hom}_R(R^{(I)}, M) \cong \prod_I \text{Hom}_R(R, M)$, while there is a homomorphism $f : {}_R R \rightarrow {}_R M$ such that $f(1) = x$, then there is $\varpi \in \text{Hom}_R(R^{(I)}, M)$ such that $\varpi(a) = x$. Hence $R^F = R^{(I)}$ is a generator.
17. Since \mathbb{Q}/\mathbb{Z} is injective generator of \mathbb{Z} -module, then ${}_R M$ is flat if and only if $\text{Hom}_{\mathbb{Z}}(M, \mathbb{Q}/\mathbb{Z})$ is a injective right R -module.(cf. Proof of Projective 2.5.5)
18. For any $f \in \text{Hom}_{\mathbb{Z}}(\mathbb{Q}, \mathbb{Q}/\mathbb{Z})$ and any $n \neq 0$, $f_1(a) = f(\frac{1}{n}a)$ for any $a \in \mathbb{Q}$, then $f_1 \in \text{Hom}_{\mathbb{Z}}(\mathbb{Q}, \mathbb{Q}/\mathbb{Z})$ such that $nf_1 = f$, i.e. $n\text{Hom}_{\mathbb{Z}}(\mathbb{Q}, \mathbb{Q}/\mathbb{Z}) = \text{Hom}_{\mathbb{Z}}(\mathbb{Q}, \mathbb{Q}/\mathbb{Z})$, Therefore $\text{Hom}_{\mathbb{Z}}(\mathbb{Q}/\mathbb{Z})$ is a divisible abelian group, hence ${}_Z \mathbb{Q}$ is flat.
